ABSTRACT

Time, thinking are the main dimensions. Thinking act by our five sense organs, eye, ear, nose, tongue, skin. When \( \frac{dT}{dt} = 1 \) then the person feels the world properly with time. When \( >1 \) then he is thinking higher. When \( <1 \) he thinks slowly. In case of different person the capital \( T \) (thinking) and small \( t \) changing rate is different.

There are only two dimensions in real life, which are time (t) and thinking(T). When \( \frac{dT}{dt} > 1 \) then it happens for fast thinker, \(<1 \) for less thinker, \( =1 \) for general thinkers. Some time the value becomes \( >1 \) or \( <1 \). This is the main thing of my view. Thinking depends on five senses.
