II. RASPBERRY PI

Fig. 1. Raspberry pi board[2]

Raspberry Pi (shown in Fig. 1) is a credit-card-sized single board computer developed in the UK by Raspberry Pi foundation with the intention of stimulating the teaching of basic computer science in schools. It has two models; Model A has 256Mb RAM, one USB port and no network connection. Model B has 512Mb RAM, 2 USB ports and an Ethernet port. It has a Broadcom BCM2835 system on a chip which includes an ARM1176JZF-S 700 MHz processor, Video Core IV GPU, and an SD card. The GPU is capable of Blu-ray quality playback, using H.264 at 40MBits/s. It has a fast 3D core accessed using the supplied Open GL ES2.0 and Open VG libraries. The chip specifically provides HDMI and there is no VGA support. The foundation provides Debian and Arch Linux ARM distributions and also Python as the main programming language, with the support for BBC BASIC, C and Perl, detailed description of Raspberry Pi board has been given in Fig. 2 (Raspberry Pi user guide). Python was chosen as the main programming language, as it is generally accepted to be both easy to learn and a fully fledged, programming language suitable for real world applications. With the addition of NumPy, SciPy, Matplotlib, I Python, and PyLab, Python can be used for computational mathematics as well as for the analysis of experimental data or control systems. Also, the recent development of the Raspberry Pi minicomputer has unlocked great potential for computing to be applied in a vast number of areas. Due to the unique advantages of the Raspberry Pi system, this technology holds great promise for providing solutions within the developing
world. This includes but is not limited to education tools, especially the use of GPIO (General Purpose Input/Output) which allows automated data acquisition and producing simple digital control systems in a school laboratory setting. The most distinctive feature of the Raspberry Pi when used for educational purposes is the GPIO module, which allows interfacing with general purpose electronics.

**III. VIRTUAL NETWORK COMPUTING (VNC SERVER)**

VNC was originally developed at the Olivetti & Oracle Research Lab in Cambridge, United Kingdom. The original VNC source code and many modern derivatives are open source under the GNU General Public License. In computing, Virtual Network Computing (VNC) is a graphical desktop sharing system that uses the Remote Frame Buffer protocol (RFB) to remotely control another computer. It transmits the keyboard and mouse events from one computer to another, relaying the graphical screen updates back in the other direction, over a network. VNC is platform-independent – there are clients and servers for many GUI-based operating systems and for Java. Multiple clients may connect to a VNC server at the same time. Popular uses for this technology include remote technical support and accessing files on one’s work computer from one’s home computer, or vice verse. The VNC server is the program on the machine that shares its screen. The server passively allows the client to take control of it. The VNC client (or viewer) is the program that watches, controls, and interacts with the server. The client controls the server.

Tight VNC is used in Raspberry Pi. Firstly the VNC server is setup and installed in Raspberry Pi.

**VNC (Setup Procedure)**

1. Setup a static IP address
2. Install VNC on the Raspberry pi
3. Setup VNC to run at boot

**IV. SYSTEM CONFIGURATION**

Fig. 5 describes the configuration of the proposed system. Raspberry Pi has been chosen as the processing unit for the system because of its user friendly features and economical benefits. Further, python coded algorithm has been fed into the raspberry Pi and is connected to the internet through Modulator DE-modulator (MODEM) interface to access and send e-mails to the consumer. Terminal window is used to display the status and response depending on the mail received. A display is to be connected to view the instantaneous status and processing of raspberry Pi.

![Image of Raspberry Pi System Configuration](image3)
The code for implementing the control strategy for home automation was written in python environment on Raspberry Pi. Firstly, the code was set to initialize and log in into home g-mail account (g mail- i map) using the e-mail library of python IDE. After successful initialization, Raspberry Pi starts reading the subjects of e-mails from the account specified in the code. The subject of these e-mails is then compared from the initializing commands. This process is repeated continuously at an interval of 0.5 seconds. Fig. 5 represents the algorithm of the used code in the form of flowchart. Here, the subject read from the e-mail is stored, and if the subject is 'ON', Raspberry Pi replies 'Turning On ' to the sender and the structure is looped for checking new mail after every 0.5

VI. PERFORMANCE

Results were generated by a series of E-mails sent to the G-mail account of raspberry pi and the corresponding in box and sent mails of raspberry G-mail account. For example, an E-mail with the subject 'ON' was send to Raspberry Pi account from the consumer account. The algorithm, read the subject 'ON' and display's the message on the terminal window. and instantly replied to sender by an email - 'Turning ON switch ' under the subject - 'Home automation activated'. The code also includes exception handling in case of invalid e-mail from the consumer. Similarly the same switch can be turned OFF by sending an e-mail with subject 'OFF' to the raspberry Pi account. So, the results show that home automation has been successfully implemented with efficiency and reliability.

VII. CONCLUSION AND FUTURE WORK

In this highly developing era, where directly or indirectly, everything is dependent on computation and information technology, Raspberry Pi proves to be a smart, economic and efficient platform for implementing the home automation. This paper provides a basic application of home automation using Raspberry Pi which can be easily implemented and used efficiently. The code provided is generic and flexible in a user friendly manner and can be extended for any future applications like power control, surveillance, etc, easily. Moreover, this technique is better than other home automation methods is several ways. For example., in home automation through DTMF, the call tariff is a huge disadvantage, which is not the case in proposed method. Also, in Web server based home automation, the design of web server and the space required is eliminated by this method, because it simply uses the already existing web server provided by G-mail.
