Abstract— In this paper, we introduce some basic idea of Variational iteration method for short (VIM) to solve the Volterra’s integro-differential equations. The VIM is used to solve effectively, easily, and accurately a large class of non-linear problems with approximations which converge rapidly to accurate solutions. For linear problems, it’s exact solution can be obtained by only one iteration step due to the fact that the Lagrange multiplier can be exactly identified. It is to be noted that the Lagrange multiplier reduces the iteration on integral operator and also minimizes the computational time. The method requires no transformation or linearization of any forms. Two numerical examples are presented to show the effectiveness and efficiency of the method. Also, we compare the result with the result from Homotopy perturbation method (HPM). Finally, we investigate the absolute difference between variational iteration method and homotopy perturbation method and draw the graph of difference function by using Mathematica.

Keywords — Variational iteration method, Integro-differential equation, Lagrange multiplier, Homotopy perturbation method, Exact Solution, General solution, Approximate solution.

1. Introduction

Volterra studied the hereditary influences when he was examining a population growth model. The research work resulted in a specific topic, where both differential and integral operators appeared together in the same equation. This new type of equations was termed as Volterra integro-differential equations, given in the form

\[ p^{(n)}(x) = f(x) + \lambda \int_{0}^{x} K(x,t)p(t) \, dt, \]  

(1)

Where \( p^{(n)}(x) = \frac{d^n p}{dx^n} \). Because the resulted equation in (1) combines the differential operator and the integral operator, then it is necessary to define initial conditions \( p(0), p'(0), \ldots, p^{(n-1)}(0) \) for the determination of the particular solution \( p(x) \) of the Volterra integro-differential equation (1). Any Volterra integro-differential equation is characterized by the existence of one or more of the derivatives \( p'(x), p''(x), \ldots \) outside the integral sign. The Volterra integro-differential equations may be observed when we convert an initial value problem to an integral equation by using Leibnitz rule. The Volterra integro-differential equation appeared after its establishment by Volterra. It then appeared in many physical applications such as glass forming process [1], nano-hydrodynamics [2], heat transfer, diffusion process in general, neutron diffusion and biological species coexisting together with increasing and decreasing rates of generating, and wind ripple in the desert. More details about the sources where these equations arise can be found in physics, biology and engineering applications books. To determine a solution for the integro-differential equation, the initial conditions should be given, and this may be clearly seen as a result of involving \( p(x) \) and its derivatives. The initial conditions are needed to determine the exact solution.

There are various numerical and analytical methods to solve such problems, for example, the homotopy perturbation method [3], the Adomian decomposition method [4], but each method limits to a special class of integro-differential equations. J.H. He used the variational iteration method for solving some integro-differential equations [5]. This Chinese mathematician chooses [5] initial approximate solution in the form of exact solution with unknown constants. M. Ghasemi et al solved the nonlinear Volterra’s integro-differential equations [6] by using homotopy perturbation method. In [7], the variational iteration method was applied to solve the system of linear integro-differential equations. Also, J. Biazar et al solved systems of integro-differential equations by He’s homotopy perturbation method [8].

2. History of Variation Method (VIM)

The variational iteration method (VIM) developed in 1999 by He in [9-18] will be used to study the linear wave equation, nonlinear wave equation, and wave-like equation in bounded and unbounded domains. The
method has been proved by many authors [19-31] to be reliable and efficient for a wide variety of scientific applications, linear and nonlinear as well. It was shown by many authors that this method is more powerful than existing techniques such as the Adomian method [32,33], perturbation method, etc. The method gives rapidly convergent successive approximations of the exact solution if such a solution exists; otherwise a few approximations can be used for numerical purposes.

The method is effectively used in [10-25] and the references therein. The perturbation method suffers from the computational workload, especially when the degree of nonlinearity increases. Moreover, the Adomian method suffers from the complicated algorithms used to calculate the Adomian polynomials that are necessary for nonlinear problems. The VIM has no specific requirements, such as linearization, small parameters, etc. for nonlinear operators.

The variational iteration method, which is a modified general Lagrange multiplier method [34] has been shown to solve effectively, easily and accurately, a large class of nonlinear problems with approximations which converge quickly to accurate solutions. It was successfully applied to autonomous ordinary differential equation [13], to nonlinear partial differential equations with variable coefficients [35], to Schrödinger-KDV, generalized KDV and shallow water equations [36], to Burgers’ and coupled Burgers’ equations [37], to the linear Helmholtz partial differential equation [38] and recently to nonlinear fractional differential equations with Caputo differential derivative [39], and other fields [10,20,40,41-44]. On the other hand, one of the interesting topics among researchers is solving integro-differential equations.

3. Variational Iteration Method for Solving Volterra’s Integro-Differential Equations

The purpose of this paper is to extend the analysis of the variational iteration method to solve the system of general nonlinear Volterra’s integro-differential equations which is as follows:

$$\begin{align*}
p_{1}^{(m)}(x) &= H_{1}(x, p_{2}(x), ..., p_{2}^{(m)}(x), p_{3}(x), ..., p_{3}^{(m)}(x), ..., p_{n}(x), ..., p_{n}^{(m)}(x)) + \int K_{1}(x, t, p_{1}(t), ..., p_{1}^{(m)}(t), ..., p_{n}(t), ..., p_{n}^{(m)}(t)) dt \\
p_{2}^{(m)}(x) &= H_{2}(x, p_{2}(x), ..., p_{2}^{(m)}(x), p_{3}(x), ..., p_{3}^{(m)}(x), ..., p_{n}(x), ..., p_{n}^{(m)}(x)) + \int K_{2}(x, t, p_{1}(t), ..., p_{1}^{(m)}(t), ..., p_{n}(t), ..., p_{n}^{(m)}(t)) dt \\
&\vdots \\
p_{n}^{(m)}(x) &= H_{n}(x, p_{2}(x), ..., p_{2}^{(m)}(x), p_{3}(x), ..., p_{3}^{(m)}(x), ..., p_{n}(x), ..., p_{n}^{(m)}(x)) + \int K_{n}(x, t, p_{1}(t), ..., p_{1}^{(m)}(t), ..., p_{n}(t), ..., p_{n}^{(m)}(t)) dt
\end{align*}$$

In above system, m is order of derivatives and the continuous several variables functions $H_{i}$ and $K_{i}$, $i = 1,2,3, ..., n$ are given, the solutions to be determined are $p_{i}(x), i = 1,2,3, ..., n$.

For solving the above system by the variational iterative method, for simplicity, we consider all of terms as restricted variation except $p_{i}^{(m)}(x), i = 1,2,3, ..., n$. According to the variational iterative method, we derive correction functional as follows:

$$\begin{align*}
p_{i,k+1}(x) &= p_{i,k}(x) + \int_{0}^{x} \lambda_{i}(s) [p_{i,k}^{(m)}(s) \\
&- H_{i}(s, p_{i,k+1}(s), ..., p_{i,k}^{(m)}(s), ..., p_{i-1,k}(s), ..., p_{i-1,k}^{(m)}(s), ..., p_{i+1,k}(s), ..., p_{i+1,k}^{(m)}(s), ..., p_{n,k}(s), ..., p_{n,k}^{(m)}(s))] \\
&- \int_{0}^{s} K_{i}(s, t, p_{i,k+1}(t), ..., p_{i,k}^{(m)}(t), ..., p_{n,k}(t), ..., p_{n,k}^{(m)}(t)) dt] ds
\end{align*}$$

For $i = 1,2,3, ..., n$ and the stationary conditions of the above correction functional can be expressed as follows:
\[
\lambda_i^{(m)}(s) = 0 \\
1 - (-1)^{m-1}\lambda_i^{(m-1)}(s)|_{s=x} = 0 \\
\lambda_i^{(j)}(s)|_{s=x} = 0, \quad j = 1, 2, 3, \ldots, m - 2, \quad i = 1, 2, 3, \ldots, n
\]

The Lagrange multiplier, therefore, can be identified as follows:
\[
\lambda_i(s) = \frac{(-1)^m}{(m-1)!} (s-x)^{m-1}
\]

As a result, we obtain the following iteration formulas
\[
p_{i,k+1}(x)
= p_{i,k}(x) + \int_0^x \frac{(-1)^m}{(m-1)!} (s-x)^{m-1} [p_{i,k}^{(m)}(s)
\]
\[
- H_i(s, p_{1,k}^{(m)}(s), \ldots, p_{i-1,k}^{(m)}(s), \ldots, p_{i+1,k}^{(m)}(s), \ldots, p_{n,k}^{(m)}(s))]
\]
\[
- \int_0^x K_i(s, t, p_{1,k}^{(m)}(t), \ldots, p_{i,k}^{(m)}(t), \ldots, p_{n,k}^{(m)}(t)) dt] ds
\]

4. Numerical Examples for Seventh Order Boundary Value Problem by Using VIM

In this section, we present two examples to show efficiency and high accuracy of the variational iteration method for solving Volterra integro-differential equations.

**Example 01** Let us consider the system of integro-differential equations as follows:
\[
\begin{align*}
p''(x) &= -1 - x^2 - \sin x + \int_0^x (p(t) + q(t)) dt \\
q''(x) &= 1 - 2 - \sin x - \cos x + \int_0^x (p(t) - q(t)) dt
\end{align*}
\]

Subjected to the initial conditions: \( p(0) = 1, \; p'(0) = 1, \; q(0) = 0, \; q'(0) = 2 \)

With the exact solutions
\[
p(x) = x + \cos x, \quad q(x) = x + \sin x
\]

According to VIM we have following iteration formulas
\[
p_{k+1}(x) = p_k(x) + \int_0^x (s-x) [p_k''(s) + 1 + s^2 + \sin s]
\]
\[
- \int_0^x (p_k(t) + q_k(t)) dt ds
\]
\[
q_{k+1}(x) = q_k(x) + \int_0^x (s-x) [q_k''(s) - 1 + 2 + \sin s]
\]
\[
+ \cos s - \int_0^x (p_k(t) - q_k(t)) dt ds
\]

Now, we choose initial approximations \( p_0(x) = 1 + x \) and \( q_0(x) = 2x \) which satisfy initial conditions then, we get
\[
p_1(x) = 1 + x + \int_0^x (x-t) \left(-1 - t^2 - \sin t \right)
\]
\[
+ \int_0^x (1 + 3T)T dt 
\]
\[
= 1 + x + \int_0^x (x-t) \left(-1 - t^2 - \sin t + t + \frac{3}{2}t^2 \right) dt 
\]
\[
= 1 + x + \int_0^x (x-t) (-1 + t + \frac{1}{2}t^2 - \sin t) dt 
\]
\[
= 1 - \frac{1}{2}x^2 + \frac{1}{6}x^3 + \frac{1}{24}x^4 + \sin x 
\]
\[
\therefore p_1(x) = 1 - \frac{1}{2!}x^2 + \frac{1}{3!}x^3 + \frac{1}{4!}x^4 + \sin x
\]
\[
q_1(x) = 2x + \int_0^x (x-t) \left(1 - 2 - \sin t - \cos t \right)
\]
\[
+ \int_0^x (1 - T)T dt 
\]
\[
= 2x + \int_0^x (x-t) (-1 + t - \frac{1}{2}t^2 - \sin t - \cos t) dt 
\]
\[
= 2x - \frac{1}{2}x^2 + \frac{1}{6}x^3 + \frac{1}{24}x^4 - x + \sin x + \cos x - 1
\]
\[
= -1 + x - \frac{1}{2}x^2 + \frac{1}{6}x^3 - \frac{1}{24}x^4 + \sin x + \cos x 
\]
\[
\therefore q_1(x) = -1 + x - \frac{1}{2!}x^2 + \frac{1}{3!}x^3 - \frac{1}{4!}x^4 + \sin x + \cos x
\]

Similarly,
\[
p_2(x) = x + \left(1 - \frac{1}{21!}x^2 + \frac{1}{4!}x^4 - \frac{1}{6!}x^6 + \cdots \cdots \right) 
\]
\[
q_2(x) = x + \left(x - \frac{1}{31!}x^3 + \frac{1}{5!}x^5 - \frac{1}{7!}x^7 + \cdots \cdots \right)
\]

Thus, the close form solution are as follows:
\[ p(x) = \lim_{n \to \infty} p_n(x) = x + \cos x \]

\[ q(x) = \lim_{n \to \infty} q_n(x) = x + \sin x \]

This example has been solved by homotopy perturbation method in [45]. The solutions of this example by homotopy perturbation method (HPM) are obtained as:

\[
\begin{align*}
 p(x) &= 4 + x - 2x^2 + \frac{x^4}{6} - \frac{x^6}{180} + \frac{x^8}{10080} - \frac{x^{10}}{907200} - \frac{1556755200}{x^{13}} - \frac{3 \cos x}{90720} - \frac{9979200}{1556755200} \\
 q(x) &= 5x - \frac{2x^3}{3} + \frac{x^5}{30} - \frac{x^7}{1260} + \frac{x^9}{90720} - \frac{x^{11}}{9979200} - \frac{3 \sin x}{1556755200}
\end{align*}
\]

**Figure 1. Comparison of VIM with HPM for Example 01**
Example 02 Consider the following system of nonlinear integro-differential equations:

\[
p''(x) = 1 - \frac{1}{3}x^3 - \frac{1}{2}q'(x) + \frac{1}{4} \int_0^x (p^2(t) + q^2(t)) dt
\]

\[
q''(x) = -1 + x^2 - xp(x) + \frac{1}{4} \int_0^x (p^2(t) - q^2(t)) dt
\]

\[
p_{n+1}(x) = p_n(x) + \int_0^x (x-t)(1-\frac{1}{3}t^3 - \frac{1}{2}q'(t) + \frac{1}{2} \int_0^t (p_n^2(T) + q_n^2(T)) dT) dt
\]

\[
q_{n+1}(x) = q_n(x) + \int_0^x (x-t)(-1 + t^2 - tp(t) + \frac{1}{4} \int_0^t (p_n^2(T) - q_n^2(T)) dT) dt
\]

Where \( p_n(x) = 2x + 1 \), \( q_n(x) = 1 \) and \( p_n(x), q_n(x) \) indicates the nth approximation of \( p(x) \) and \( q(x) \) respectively. Now,

\[
p_1(x) = 2x + 1 + \int_0^x (x-t) \left(1 - \frac{1}{3}t^3 + \frac{1}{2} \int_0^t (4t^2 + 4T^2 + 2) dT \right) dt
\]

\[
= 2x + 1 + \int_0^x (x-t) \left(1 - \frac{1}{3}t^3 + \frac{1}{2} \left(\frac{4}{3}t^3 + 2t^2 + 2t \right) \right) dt
\]

\[
= 2x + 1 + \int_0^x (x-t) \left(1 - \frac{1}{3}t^3 + \frac{2}{3}t^3 + t^2 + t \right) dt
\]

\[
= 2x + 1 + \int_0^x (x-t) \left(1 + \frac{1}{3}t^3 + t^2 + t \right) dt
\]

\[
= 2x + 1 + \left(2 + \frac{1}{12}x^5 + \frac{1}{3}x^4 + \frac{2}{3}x^3 \right)
\]

\[
\qquad - \left(\frac{1}{2}x^2 + \frac{1}{15}x^5 + \frac{1}{4}x^4 + \frac{1}{3}x^3 \right)
\]

Subject to the initial conditions:

\( p(0) = 1, \quad p'(0) = 2, \quad q(0) = -1, \quad q'(0) = 0 \)

Consider the initial conditions, the following iterative relations are obtained as

\[
p_1(x) = 1 + \int_0^x (x-t) \left(-1 + t^2 - 2t + 1 \right) dt
\]

\[
= 1 + \frac{1}{4} \int_0^x (4T^2 + 4T) dT
\]

\[
= 1 + \frac{1}{4} \left(4 \left(\frac{4}{3}t^3 + 2t^2 \right) \right) dt
\]

\[
= 1 + \int_0^x (x-t) \left(-1 + t^2 - 2t + \frac{4}{3}t^3 + 2t^2 \right) dt
\]

\[
= 1 + \int_0^x (x-t) \left(-2t^2 - t + \frac{1}{3}t^3 + \frac{1}{2}t^2 \right) dt
\]

\[
= 1 + \left(-x^2 - \frac{1}{6}x^4 - \frac{2}{3}x^3 + \frac{1}{12}x^5 \right)
\]

\[
\qquad - \left(-\frac{1}{2}x^2 - \frac{1}{8}x^4 - \frac{1}{3}x^3 + \frac{1}{15}x^5 \right)
\]
\[
= 1 - \frac{1}{2} x^2 - \frac{1}{6} x^3 - \frac{1}{24} x^4 + \frac{1}{60} x^5
\]
\[
\therefore q_1(x) = 1 - \frac{1}{2} x^2 - \frac{1}{6} x^3 - \frac{1}{24} x^4 + \frac{1}{60} x^5
\]
Similarly, 
\[
p_2(x) = 1 + 2x + \frac{1}{2} x^2 + \frac{1}{6} x^3 + \frac{1}{24} x^4 + \frac{1}{120} x^5 + \frac{1}{720} x^6 + \frac{17}{5040} x^7 + \frac{1}{672} x^8 + \frac{53}{120960} x^9
- \frac{1}{103680} x^{10} + \frac{1}{228096} x^{11}
+ \frac{1}{1900800} x^{12} + \frac{1}{6177600} x^{13}
+ \frac{1080}{11} x^7 + \frac{241920}{47} x^9
+ \frac{1036800}{11404800} x^{11}
+ \frac{1}{1267200} x^{12}
\]
\[
q_2(x) = -1 - \frac{1}{2} x^2 - \frac{1}{6} x^3 - \frac{1}{24} x^4 - \frac{1}{120} x^5 - \frac{1}{720} x^6
- \frac{1080}{11} x^7 + \frac{241920}{47} x^9
+ \frac{1036800}{11404800} x^{11}
+ \frac{1}{1267200} x^{12}
\]

and so on.

Thus, the closed from solution are as follows:
\[
p(x) = \lim_{n \to \infty} p_n(x) = x + e^x
\]
\[
q(x) = \lim_{n \to \infty} q_n(x) = x - e^x
\]

This example has been solved by homotopy perturbation method in [45]. The solutions of this example by homotopy perturbation method (HPM) are obtained as:
\[
p(x) = 1 + 2x + \frac{1}{2} x^2 + \frac{1}{6} x^3 + \frac{1}{24} x^4 + \frac{1}{120} x^5 + \ldots \ldots 
\]
\[
q(x) = -1 - \frac{1}{2} x^2 - \frac{1}{6} x^3 - \frac{1}{24} x^4 - \frac{1}{120} x^5 - \ldots \ldots 
\]

5. Conclusion

In this paper, we applied the Variational Iteration Method (VIM) for solving the systems of Volterra integro-differential equations. It is important to point out that some other methods should be applied for systems with separable or difference kernels. Whereas, the VIM can be used for solving systems of Volterra integro-differential equations with any kind of kernels. By comparing the results of other numerical methods such as homotopy perturbation method, we conclude that the VIM is more accurate, fast and reliable. Besides, VIM does not require small parameters; thus, the limitations of the traditional perturbation methods can be eliminated, and the calculations are also simple and straightforward. These advantages have been confirmed by employing two examples. Therefore, this method is a very effective tool for calculating the exact solutions of systems of integro-differential equations.
